

Exercise 2. Install the Linux Data Science VM

In this exercise, you will

1. Create a password protected private and public key
2. Install and deploy the Linux DS VM using your public key
3. Download X2GO and use it to visit your VM
4. Run Jupyter on the VM through the jupyter hub

Step 1

You will need a public-private key pair.

If you have a mac or linux do this

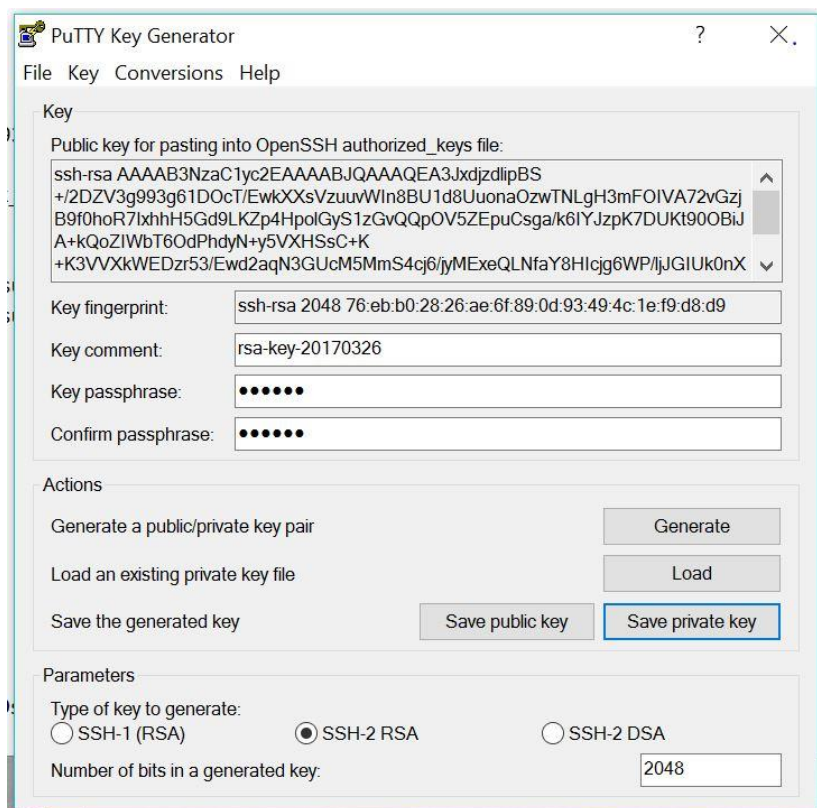

>ssh-keygen

And follow the instruction. This will generate two files. One is your private key and the other has the extension .pub. this is the public key you will upload to your VM.

If you are on a windows machine do this

Download and Install PuTTY. From www.putty.org

This should contain two programs. PuTTY and PuTTYgen. Run PuTTYgen. After a few mouse moves you will see

Give it a password (key passphrase) and save the public and private keys.

Step 2. Install the Linux Data Science VM

Using your Azure account connect to the portal and sign in. Hit the plus sign in the upper left corner and then the picture of the little monitor in the lower left.

Using the Azure portal to create a VM

The screenshot shows the Azure portal interface. On the left, a sidebar contains a plus sign and a monitor icon. A blue arrow points from the text 'Click this To bring up The VM page Then click Add' to the plus sign. The main area shows the 'Virtual machines' page with a search bar. A blue arrow points from the text 'In the search box enter "data science" and you will see this choice. Pick this one and click here' to the search results. The search results show 'Linux Data Science Virtual Machine' as the only option.

Next do the basic configuration

The screenshot shows the 'Create virtual machine' dialog box in the Azure portal. The 'Basics' tab is selected. The dialog box has a sidebar with five steps: 1. Basics (Configure basic settings), 2. Size (Choose virtual machine size), 3. Settings (Configure optional features), 4. Summary (Linux Data Science Virtual Machine), and 5. Buy. The main area contains the following fields:

- Name: myDataScienceVM
- VM disk type: SSD
- User name: dbgannon
- Authentication type: SSH public key (selected), Password
- SSH public key: -----BEGIN SSH2 PUBLIC KEY-----
Comment: "rsa-key-20170210"
AAAAAB3NzaC1yc2EAAAABJQAAAQEAi+S
oqE+zhRcAt8wsF31YDgpwTQSnVMwQ5c
- Subscription: azure4research
- Resource group: Create new (selected), Use existing, bookRG
- Location: South Central US

An 'OK' button is at the bottom right.

Give your vm a name

Give yourself a user ID

Copy and paste your public key here

You probably don't have a resource group, so select "create new"

South Central US works for me. It will tell you which regions you are allowed to use.

If everything has a green check mark then click OK

You next must select a server type for this VM. You will get three choices

DS2_V2 Standard	DS3_V2 Standard	DS14_V2 Standard
2 Cores	4 Cores	16 Cores
7 GB	14 GB	112 GB
4 Data disks	8 Data disks	32 Data disks
6400 Max IOPS	12800 Max IOPS	50000 Max IOPS
14 GB Local SSD	28 GB Local SSD	224 GB Local SSD
Load balancing	Load balancing	Load balancing
Premium disk support	Premium disk support	Premium disk support
94.49 USD/MONTH (ESTIMATED)	189.72 USD/MONTH (ESTIMATED)	989.52 USD/MONTH (ESTIMATED)

Pick the one you can “afford”. Then go to the next step. Just click OK to accept all the defaults. And finally click “Buy”.

When the VM starts you should be able to see it in the portal on your dashboard (which you get to by clicking on the big [Microsoft Azure](#) in the upper left corner. You should see:

Connect Start Restart Stop Capture Delete

Essentials

Resource group (change) [bookRG](#)

Status **Running**

Location **South Central US**

Subscription name (change) [azure4research](#)

Subscription ID [f518fe6b-5262-4e5a-80cb-05b7a39f9298](#)

Computer name **myDataScienceVM**

Operating system **Linux**

Size **Standard DS14 v2 (16 cores, 112 GB mem...**

Public IP address/DNS name label [13.84.55.19/<none>](#)

Virtual network/subnet [bookRGvnet771/default](#)

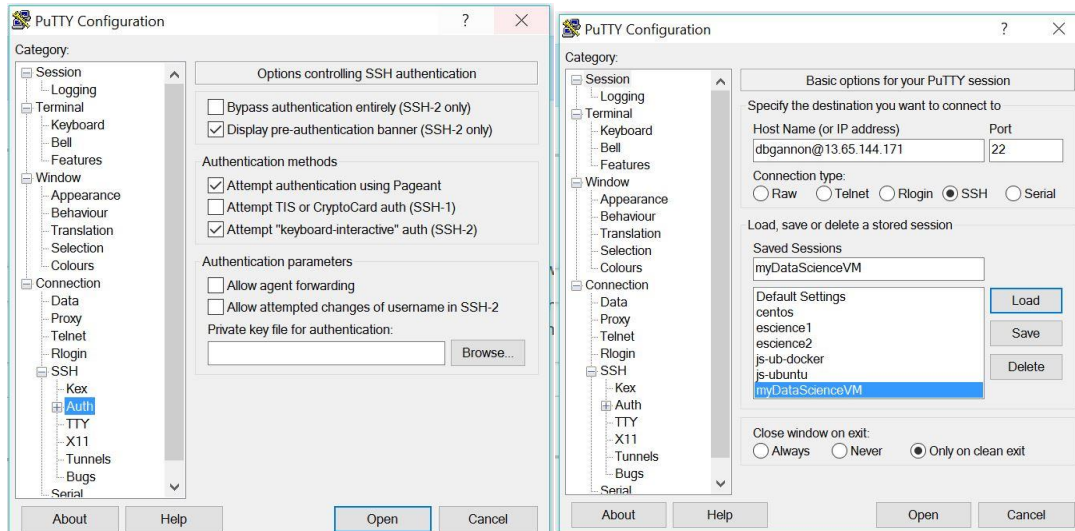

Monitoring

Make note of the IP address. You should be able to log into your VM with your private key as follows.

For the Mac or Linux type

```
>ssh -i path-to-your-privatekey userid@ipaddress
```

For Windows run Putty. You will need to upload your private key into the putty client

Then return to the session tab and enter your userid@yourVM-IP-address. You can give it a name and select “save”. This will save the configuration for next time. Next select “open”.

While you are logged into the vm, you should also set your local password. Type

```
> sudo passwd userid
```

```
> enter your password twice
```

We will use this to run jupyter.

Step 3. Run jupyter

The system is already running a tool called jupyter hub that will allow you to log in and start a jupyter session in your browser. Go to <https://youvm-IP:8000>. Login with your userid and password.

In the upper right of the page is a tab called “new”. Pull down that tab and select “terminal”. This gives you a bash shell where you can download or manage files. Do this

```
$ cd notebooks
```

```
$ wget https://sciengcloud.github.io/jupyter.ipynb jupyter.ipynb
```

Now go back to the jupyter home page and you should see jupyter.ipynb. this is a tiny intro to jupyter. Run it.

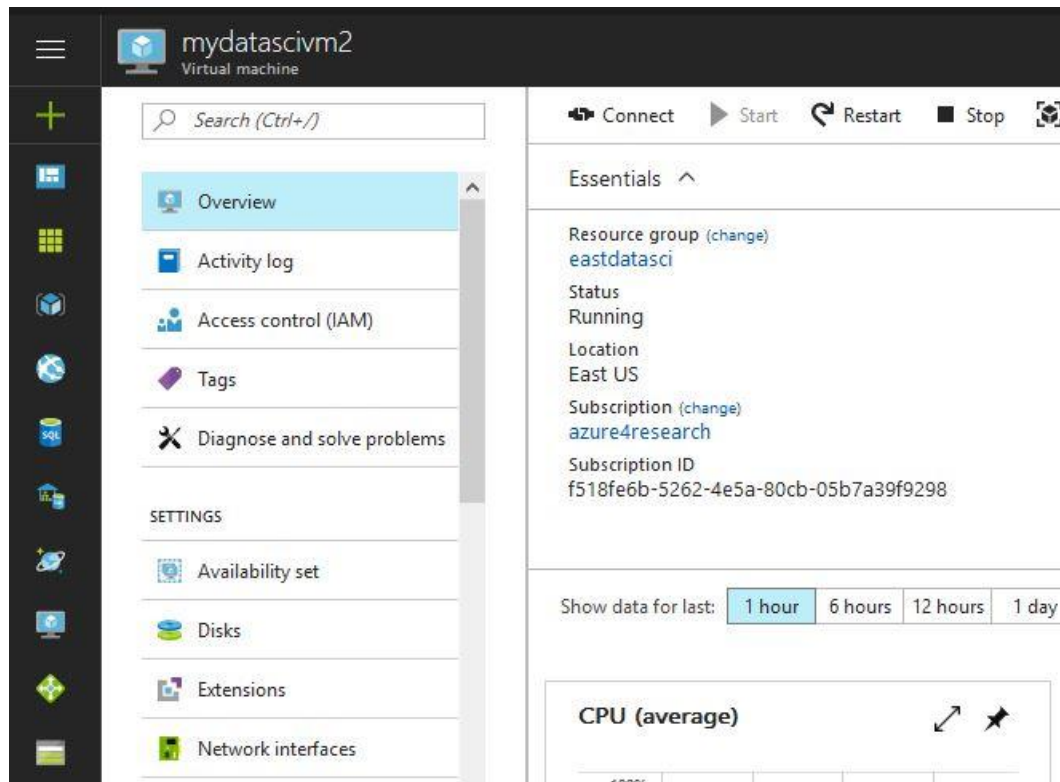

There are many other great examples here already here. For a deeper intro to jupyter and python.

Load IntroToJupyterPython.ipynb and step through it.

Step 4. Open TCP port 8888 for the docker tutorial package

In order to access additional services running on your VM we need to open another external IP port.

Go to the portal page for your VM. Look on the left column. Click on the tab labeled “Network interfaces”.

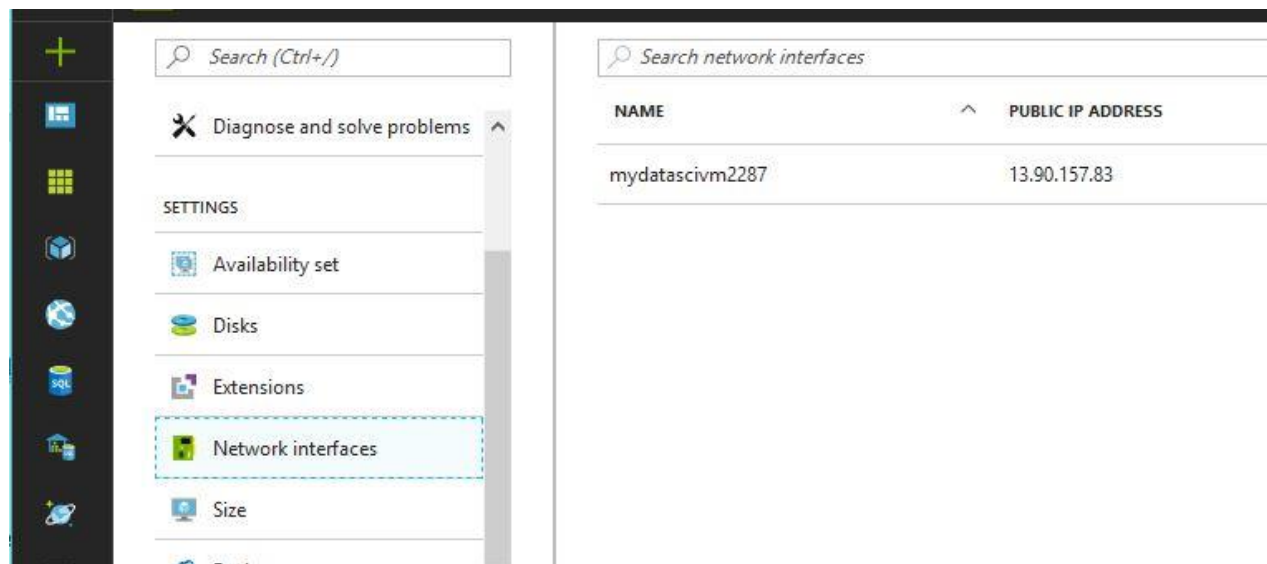

The screenshot shows the Azure portal interface for a virtual machine named 'mydatasci2'. The left sidebar contains a search bar and a list of navigation options: Overview (selected), Activity log, Access control (IAM), Tags, Diagnose and solve problems, SETTINGS, Availability set, Disks, Extensions, and Network interfaces. The main content area displays the 'Essentials' section with the following information:

- Resource group: [eastdatasci](#) (change)
- Status: Running
- Location: East US
- Subscription: [azure4research](#) (change)
- Subscription ID: f518fe6b-5262-4e5a-80cb-05b7a39f9298

Below this information, there is a 'Show data for last:' section with buttons for 1 hour (selected), 6 hours, 12 hours, and 1 day. A 'CPU (average)' chart is partially visible at the bottom.

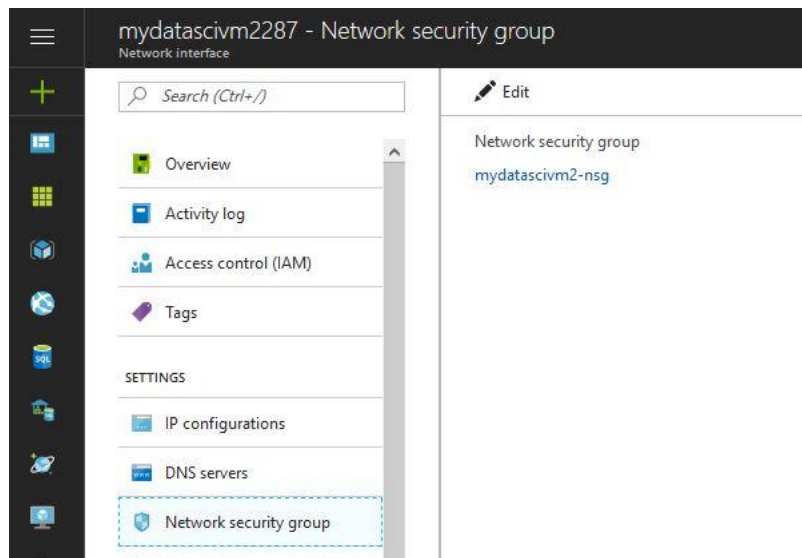

From there click on the interface name shown on the right side.

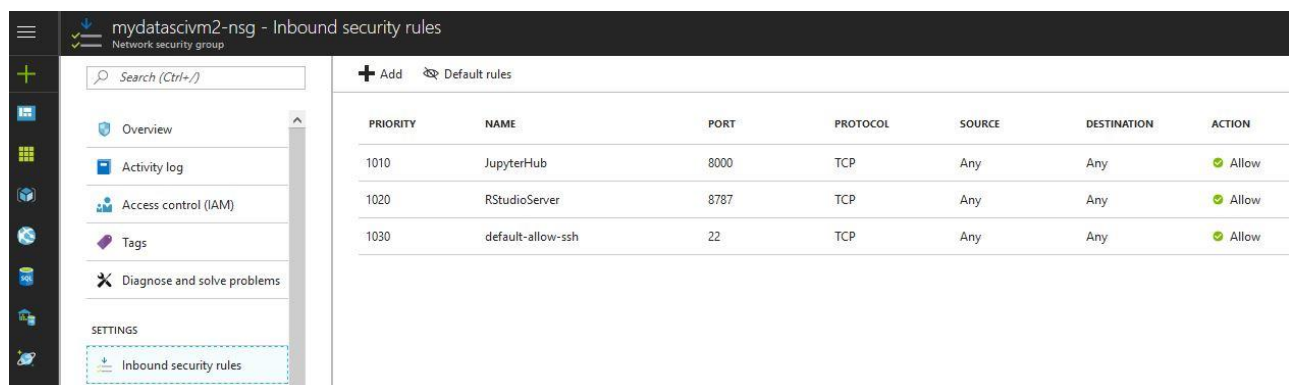

The screenshot shows the Azure portal interface for the 'Network interfaces' page of the virtual machine 'mydatasci2'. The left sidebar is the same as in the previous screenshot, but the 'Network interfaces' option is now selected and highlighted with a dashed blue border. The main content area displays a table of network interfaces:

Search network interfaces	
NAME	PUBLIC IP ADDRESS
mydatasci2287	13.90.157.83

From there click on the security group tab on the left and then on the name of the security group on the right.

This finally gets us to something we need. Select “inbound security rules”. We see the ports that are currently open. We want to add one more. Click on the “+ Add”.

Fill in the port range as 8888 and give it a name. then click o.k.

Refresh the view and you will see your now port. Next go back to your shell on the VM and type

```
$ sudo docker run -it -p 8888:8888 dbgannon/tutorial
```

This will take a while to down load the tutorial container. About 10 minutes. After that when you run this docker command again it will take only seconds because the image will be cached.

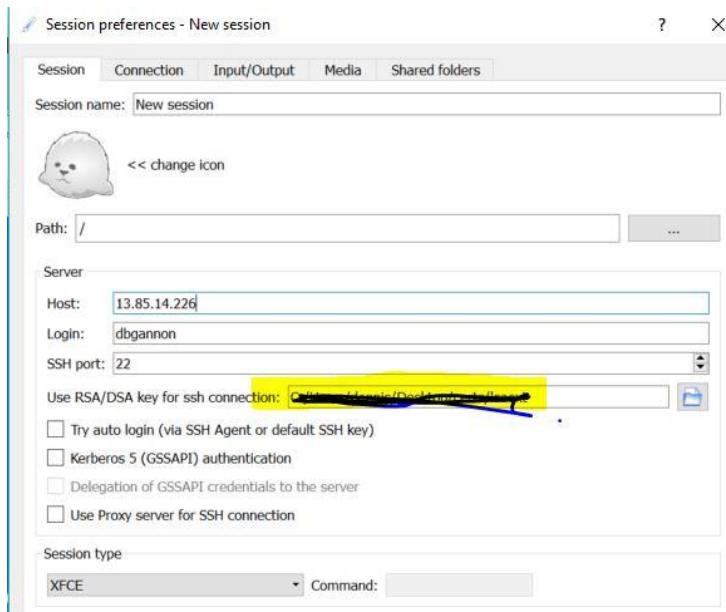

When it is done go to

<https://ipaddressOfYourVM:8888>

and login with password “tutorial”. The notebook directory contains examples for Azure, Amazon and Google. Obviously we will do the Azure ones today, but if you have an AWS account or a Google account you can try those out there too.

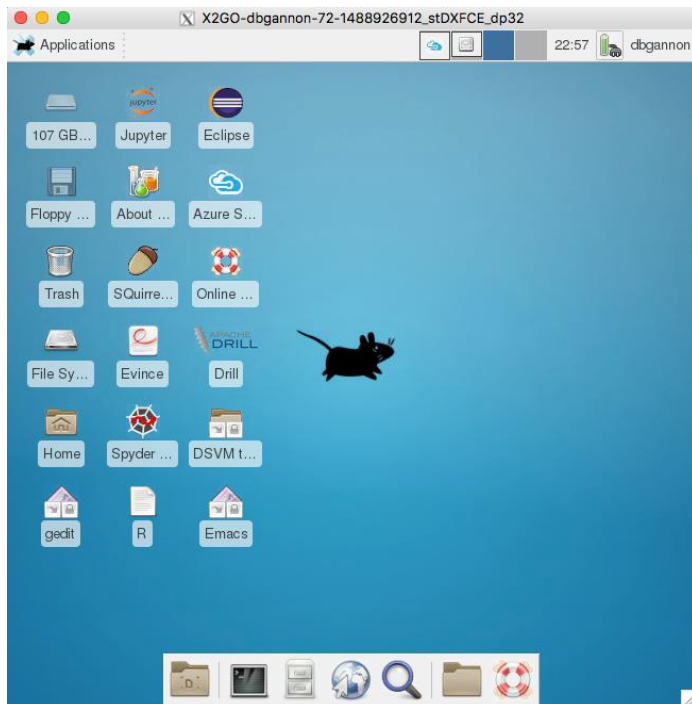

Step 5. X2Go

This step is not essential, but fun. Download X2Go. <http://wiki.x2go.org> install it. Create a new session.

You will need your ip address and login id and the path to your secret key. And set the session type XFCE

You will need to give it the password to unlock your secret key. If you are running windows it may protest but just wait. It should come up with the desktop.

From here you can launch a terminal window, file manage, web browser by looking in the bottom row of icons. There are many other tools.
